

Document Title Specification of Diagnostic and Trace	
Document Owner	AUTOSAR
Document Responsibility	AUTOSAR
Document Identification No	351
Document Classification	Standard

Document Status	Final
Part of AUTOSAR Standard	Classic Platform
Part of Standard Release	4.3.0

	Document Change History			
Date	Release	Changed by	Change Description	
2016-11-30	R4.3.0	AUTOSAR	Major rework of the SWS Dlt	
		Release	Dit Protocol moved to PRS Dit	
		Management	Protocol specification	
			Removed interaction with DCM	
2015-07-31	4.2.2	AUTOSAR	Minor corrections	
		Release		
		Management		
2014-10-31	4.2.1	AUTOSAR	Changed requirements:	
		Release	SWS_Dlt_00515, SWS_Dlt_00516,	
		Management	SWS_Dlt_00332, SWS_Dlt_0028	
2014-03-31	4.1.3	AUTOSAR	 Changed SWS_Dlt_00477 	
		Release		
		Management		
2013-10-31	4.1.2	AUTOSAR	Minor corrections	
		Release	Editorial changes	
		Management	Removed chapter(s) on change	
			documentation	
2013-03-15	4.1.1	AUTOSAR	Modeling of Services: introduction of	
		Administration	formal descriptions of service	
			interfaces	
			Reworked according to the new SWS_RSWCeneral	
			SWS_BSWGeneral	

	Document Change History			
Date	Release	Changed by	Change Description	
2011-12-22	4.0.3	AUTOSAR Administration	 Added Dlt control messages for getting values of modifiable parameters Modification and update of Dem and Dcm interfaces Added FIBEX example for non verbose transmission mode 	
2010-09-30	3.1.5	AUTOSAR Administration	 Bug fixes and extension of Dlt control message specification Update of communication with Dem (Dem_GetEventFreezeFrameData) Update of interface to Dcm (Dlt_ReadData) 	
2010-02-02	3.1.4	AUTOSAR Administration	Initial Release	

Disclaimer

This specification and the material contained in it, as released by AUTOSAR, is for the purpose of information only. AUTOSAR and the companies that have contributed to it shall not be liable for any use of the specification.

The material contained in this specification is protected by copyright and other types of Intellectual Property Rights. The commercial exploitation of the material contained in this specification requires a license to such Intellectual Property Rights.

This specification may be utilized or reproduced without any modification, in any form or by any means, for informational purposes only. For any other purpose, no part of the specification may be utilized or reproduced, in any form or by any means, without permission in writing from the publisher.

The AUTOSAR specifications have been developed for automotive applications only. They have neither been developed, nor tested for non-automotive applications.

The word AUTOSAR and the AUTOSAR logo are registered trademarks.

Advice for users

AUTOSAR specifications may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the specifications for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such specifications, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

1 Introduction and functional overview

This specification describes the functionality and the configuration of the AUTOSAR Basic Software module Dlt.

It receives log information from DET, DEM, SW-Cs, or trace information of the RTE. The Dlt module transmits this data via communication busses to make this information visible outside the ECU.

For this purpose, the DIt module defines the API to send and receive dedicated log/trace information on the bus.

In addition, the NvM module can be optionally used to store an updated filter setting of the Dlt module persistently. This enables the ECU to transmit log/trace information with the desired level without the need of an explicit setup request coming from the communication bus (via a logging tool) at every ECU startup.

The DIt module is located on top of the PduR and below the RTE.

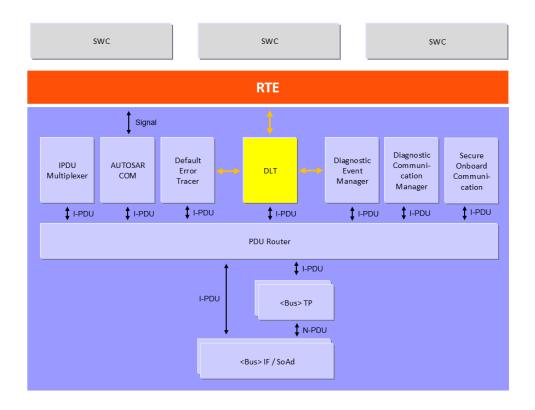

Figure 1 – Location of the Dlt module

Please note:

The Dlt Message Format, the available Dlt Commands, and the Dlt protocol (to communicate with an external logging and tracing tool) are defined in a separate document. Please refer to the [1] Dlt Protocol Specification for further information.

2 Acronyms and abbreviations

Abbreviation / Acronym:	Description:
APID	Application ID
CTID	Context ID
Dlt	Diagnostic Log and Trace
MCNT	Message Counter
MSBF	Most Significant Byte First
MSBI	Message Bus Info
MSCI	Message Control Info
MSLI	Message Log Info
MSTP	Message Type
MSTI	Message Trace Info
NOAR	Number of Arguments
STMS	Timestamp
UEH	Use Extended Header
VERB	Verbose
VERS	Version Number
WEID	With ECU ID
WSID	With Session ID
WTMS	With Timestamp

2.1 Term and definition

Term	Description:	
Log and trace message	A log and trace message contains all data and options to describe a log and trace event in a software. A log and trace message consists of a header and payload.	
Dlt User	A Dlt User represents the source of a generated Dlt message. The possible users are SW-Cs, RTE (for VFB traces), DEM, or DET.	
Log Message	A Log Message contains debug information like state changes or value changes.	
Trace Message	A Trace messages contains information, which has passed via the VFB.	
ECU ID	ECU IDis the name of an ECU, composed by four 8-bit ASCII characters (e.g., ABS0 or COMB).	
Session	A session is a logical entity of source of log or trace messages. If an application / SW-C is instantiated several times, each instance gets a globally unique session ID with respect to the application / context ID. It is possible for an application / SWC to have several simultaneous log or trace sessions, if it has several ports opened to Dlt. Since Session ID is not specified in AUTOSAR for SW-Cs, the port defined argument values shall be used for this number.	
Session ID	Session ID is the identification number of a log or trace session.	
Application ID	Application ID is an abbreviation of an application / SW-C. It identifies the	

	application / SW-C a log and trace message originates from. The Application ID is composed by four 8-bit ASCII characters.	
Context ID	Context ID is a user defined identifier to group Log and Trace Messages generated by an application / SW-C. The following rules apply: • Each ApplicationID can own several Context IDs. • Context IDs are grouped by Application IDs. • Context IDs shall be unique within an Application ID. • The source of a log and trace message is identified using the tuple "ApplicationID" and "ContextId". Four 8-bit ASCII characters compose the ContextId.	
Message ID	Messaged ID is the identifier to characterize the information, which is transported by the message itself. A Message ID identifies a kind of log or trace message uniquely. It can be used for identifying the source (in source code) of a message and it can be used for characterizing the payload of a message. A Message ID is statically fixed at development or configuration time.	
Log level	A log level defines a classification for the severity grade of a Log Message.	
Trace status	The trace status provides information, if a trace message should be send.	
Log Channel	A physical communication bus, which is used to transmit Dlt messages.	
External client	The external client is a tool to control, monitor, and store log / trace messages provided by ECUs using the Dlt module.

3.3 Related specification

AUTOSAR provides a General Specification on Basic Software (SWS BSW General) which is also valid for Dlt.

Thus, the specification SWS BSW General shall be considered as additional required specification for the Dlt module.

4 Constraints and assumptions

4.1 Limitations

VFB Tracing: Currently, VFB Trace only supports the non-verbose mode. I.e., the Dlt module will send out the arguments in a raw format, simply doing a memory copy of the arguments to the trace message.

Note:

Currently, the Dlt data type model does NOT support arbitrarily nested complex data types, which AUTOSAR does. So there is no generic way to transform arguments given to the VFB Trace hook functions into Dlt data types needed for the verbose mode.

Also an ASAM Fibex description cannot be generated by the Dlt module as the inmemory representation might not be compliant to the SWCD data type description of the arguments.

4.2 Applicability to car domains

This basic software module can be used for all car domains.

5 Dependencies to other modules

5.1 RTE

The RTE (including the VFB and the BSW Scheduler) is used to interact with SW-Cs to generate Log and Trace messages and to call the Dlt module's Tx function cyclically.

5.2 PDU Router

In order to transmit Dlt messages on the communication bus, the Dlt module interacts with the PDU Router.

5.3 NvM

In order to load and store altered configurations like filter settings and/or Log Channel assignments, the NvM module can optionally be used.

5.4 **GPT**

In order to derive a time stamp, the GPT module can be used for this purpose.

5.5 **DET**

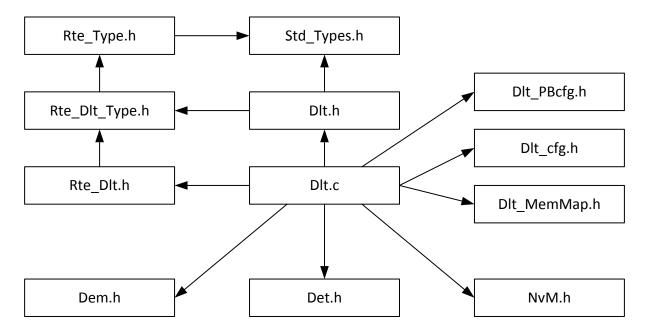

In order to be able to report default errors and to forward DET errors to the communication bus, the Dlt module has to interact with the DET module. However, the interaction with DET is optional.

5.6 **DEM**

In order to be able to report development errors and to transmit DEM events on the communication bus, the Dlt module has to interact with the DEM module. However, the interaction with DEM is optional.

5.7 File structure

[SWS_DIt_00482] The module header file Dlt.h shall include Rte_Dlt_Type.h to include the types, which are commonly used by BSW Modules and Software Components. Dlt.h and all Dlt*cfg.h files shall only contain types, that are not already defined in Rte_Dlt_Type.h.] ()

6 Requirements traceability

Requirement	Description	Satisfied by
PRS_Dlt_00635	-	SWS_Dlt_00643
SRS_BSW_00101	The Basic Software Module shall be able to initialize variables and hardware in a separate initialization function	SWS_Dlt_00239
SRS_BSW_00344	BSW Modules shall support link-time configuration	SWS_Dlt_00239
SRS_BSW_00358	The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void	SWS_Dlt_00239
SRS_BSW_00377	A Basic Software Module can return a module specific types	SWS_Dlt_00238
SRS_BSW_00402	Each module shall provide version information	SWS_Dlt_00271
SRS_BSW_00404	BSW Modules shall support post-build configuration	SWS_Dlt_00239
SRS_BSW_00405	BSW Modules shall support multiple configuration sets	SWS_Dlt_00239
SRS_BSW_00407	Each BSW module shall provide a function to read out the version information of a dedicated module implementation	SWS_Dlt_00239
SRS_BSW_00414	Init functions shall have a pointer to a configuration structure as single parameter	SWS_Dlt_00239, SWS_Dlt_00437
SRS_Dlt_00003	SWCs shall have the possibility to send log or trace messages to the DLT module.	SWS_Dlt_00241, SWS_Dlt_00243
SRS_Dlt_00004	The DLT shall provide the actual set of log levels and the trace status to a SWC.	SWS_Dlt_00252, SWS_Dlt_00254
SRS_Dlt_00006	Trace events from errors generated by BSW and SWCs shall be forwarded to the DLT module	SWS_Dlt_00430, SWS_Dlt_00432
SRS_Dlt_00007	The DEM shall forward error events to the DLT module	SWS_Dlt_00470, SWS_Dlt_00477, SWS_Dlt_00478, SWS_Dlt_00479, SWS_Dlt_00781
SRS_Dlt_00008	RTE shall provide an interface for DLT to trace RTE/VFB calls.	SWS_Dlt_00284

SRS_Dlt_00033	A list of all log and trace sources of an ECU shall be accessible from the external client.	SWS_Dlt_00021, SWS_Dlt_00245, SWS_Dlt_00769
SRS_Dlt_00034	DLT shall support a generic API for communicating over a DLT communication module.	
SRS_Dlt_00036	The DLT shall provide a buffer for storing log and trace messages before initialization	SWS_Dlt_00003
SRS_Dlt_00038	A mechanism shall be implemented to be able to set the trace status and log levels of	SWS_Dlt_00252, SWS_Dlt_00254

Specification of Diagnostic Log and Trace AUTOSAR CP Release 4.3.0

registered application IDs and context IDs of each SWC.	
The DLT shall provide the possibility to store configuration data in a persistent way.	

7 Functional specification

7.1 Dlt specification

The following chapters describe the AUTOSAR specific data and control paths the Dlt module needs for the interaction with SW-Cs, PduR, and an external client (logging tool).

7.1.1 Dlt commands

The Dlt Protocol specifies all sorts of Dlt Commands which are identified by unique Service IDs. The Dlt Commands are used to modify the behavior of the Dlt module at runtime, e.g., fetching information about the current Dlt configuration or altering filter settings.

[SWS_DIt_00643] [The AUTOSAR Dlt module shall support the following Dlt Commands identified by the following Services IDs:

Service ID	Dit Command Name	Description	
0x01	SetLogLevel	Set the Log Level	
0x02	SetTraceStatus	Enable/Disable Trace Messages	
0x03	GetLogInfo	Return the LogLevel for registered SW-Cs	
0x04	GetDefaultLogLevel	Return the Log Level for wildcards	
0x05	StoreConfiguration	Store the current configuration non volatile	
0x06	ResetToFactoryDefault	Set the configuration back to default	
0x0A	SetMessageFiltering	Enable/Disable the Dlt filters	
0x11	SetDefaultLogLevel	Set the LogLevel for wildcards	
0x12	SetDefaultTraceStatus	Enable/Disable Trace Messages for wildcards	
0x15	GetDefaultTraceStatus	Get the current TraceLevel for wildcards	
0x17	GetLogChannelNames	Return the name(s) of the LogChannel(s)	
0x1F	GetTraceStatus	Get the current trace status (on/off)	
0x20	SetLogChannelAssignment	Add/ Remove the given LogChannel as output path	
0x21	SetLogChannelThreshold	Set the filter threshold for the given LogChannel	
0x22	GetLogChannelThreshold	Get the filter threshold for the given LogChannel	
0x23	BufferOverflowNotification	Indication of a buffer overflow within the DLT module	

] (PRS_Dlt_00635)

Note:

The layouts of the defined Dlt Commands, which can be received via Dlt Control Messages, are defined in the Dlt Protocol Specification [1].

7.1.2 Dlt interaction with software components

The Dlt module offers interfaces SW-Cs can use for sending Log and Trace Messages.

Optionally, SW-Cs can provide a port for notifications on log level threshold and trace status changes, which are provided by the Dlt module separately for every tuple of ApplicationId/ContextId. These notifications can be used to avoid already the generation of Log and Trace Messages by the SW-Cs, instead of having them to be filtered out later on by the Dlt module.

Since the Dlt module supports multiple instances of SW-Cs, which use the same tuples of ApplicationId/ContextId, an additional SessionId parameter allows distinguishing log/trace messages from different instances of the same SW-C.

To separate those SW-Cs technically from each other and to avoid that SW-Cs have to use unique <code>SessionIds</code> in calls to <code>SendLogMessage/SendTraceMessage</code> (details, see next chapters), the Dlt module provides a dedicated P-Port per configured SW-C (see configuration parameter <code>DltSwc</code>) where the <code>SessionId</code> is managed as a port-defined-argument.

If a configured SW-C is marked as being interested in notifications on log level and trace state changes, the Dlt module also provides a corresponding R-Port to notify the respective SW-C.

The information, which SW-C is responsible for which <code>ApplicationId/ContextId</code> tuples, is configured for the SW-C and/or updated by the SW-C during runtime with a call to <code>RegisterContext</code> and <code>UnregisterContext</code> respectively.

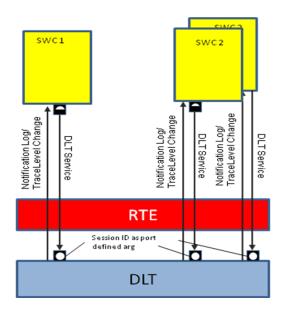

Figure 2 - Interaction with SW-C (Port configuration)

[SWS_DIt_00644] [The DIt module shall provide a P-Port typed by interface DltService (see chapter 8), for each configured SW-C (see configuration container DltSwc).] ()

[SWS_DIt_00645] [The P-Port typed by interface has SessionId as a port-defined argument.] ()

[SWS_DIt_00646] [The DIt module shall provide an R-Port typed by interface LogTraceSessionControl (see chapter 8), for each configured SW-C (see configuration container DltSwc), where the configuration parameter DltSwcSupportLogLevelChangeNotification is set to TRUE.] ()

[SWS_DIt_00647] [The ApplicationId/ContextId tuples for which the SW-C is responsible for and therefore needs to be notified in case of log level or trace state changes shall be deduced from configuration parameter DltSwcContext.] ()

7.1.2.1 Registering ApplicationIDs and ContextIds to Dlt

The Dlt module is able to inform SW-Cs about a log level change. For this purpose, they have to register at the Dlt module, using a tuple of ApplicationId/ContextId at runtime.

Note:

Because the developing of SW-C is not object of this specification, the Dlt module has to collect this information at runtime.

[SWS_DIt_00765] [The Dlt module shall remember all tuples of ApplicationIDs and ContextIds of the SW-Cs, which register to the Dlt module.] ()

[SWS_DIt_00766] [The DIt module shall manage a log level and a trace state for every tuple of ContextId and ApplicationID.] ()

Note:

In addition, a dynamic registration supports the possibility for the Dlt module to see which SW-C/runnable is active and which not. This is essential to know which SW-C to inform in case of a log level or trace status change.

When a SW-C is calling the <code>Dlt_RegisterContext</code> method of the <code>DLTService</code> interface, a port defined argument value is provided (<code>SessionID</code>) to the <code>Dlt</code> module. The value of this port defined argument corresponds to <code>LogTraceSessionControl</code> interface of the SW-C/runnable for providing information about the changing of a log level to the SW-C/runnable.

[SWS_DIt_00021] [The Dlt module shall remember the relation between the registered tuple of ApplicationId/ContextId, and the port interface where this tuple is registered.] (SRS_Dlt_00033)

[SWS_DIt_00768] [If the parameter

DltGeneralRegisterContextNotification is set to TRUE, every time Dlt_RegisterContext is called, the Dlt module shall send the Dlt Control Message GetLogInfo containing the provided ApplicationId/ContextId.] ()

7.1.2.2 Unregistering ApplicationIDs and ContextIds to Dlt

In case a SW-C is going to be stopped, it should unregister itself. This information can be used to inform an external client (e.g. a logging device) about the current SW-C status.

[SWS_DIt_00773] [The DIt module shall delete all tuples of ApplicationIDs and ContextIds of the SW-Cs which unregister to the DIt module from the list of registered applications.] ()

Note:

For these tuples, the DIt module will not try to notify the corresponding SWC any more about LogLevel changes.

[SWS_DIt_00774] [If the parameter

DltGeneralRegisterContextNotification is set to TRUE, every time Dlt_UnregisterContext is called, the Dlt module shall send the Dlt Control Message GetLogInfo containing the provided ApplicationId/ContextId with parameter "status" set to 6. | ()

7.1.2.3 Port defined argument values and LogTraceSessionControl interface

For every function call of Dlt_SendLogMessage, Dlt_SendTraceMessage, Dlt_RegisterContext and Dlt_UnregisterContext, a port defined argument value needs to be provided.

[SWS_DIt_00022] [Port defined argument values shall be used by the Dlt module as SessionIds. | ()

Note:

A session is the part of a SW-C for which a log level monitor is responsible. For each log level monitor the same SessionId (port defined argument value) shall be used.

[SWS_DIt_00023] [The port defined argument value corresponds to the defined

SessionID. The value shall start at 0x1000 (for BSW modules the module ID is taken).] ()

[SWS_DIt_00332] [Each port of a SW-C connected to the DIt module shall have a unique SessionId as port defined argument. The range of SessionIds shall be continuous. | ()

7.1.3 VFB trace

The VFB trace is specified in the RTE. The meaning of VFB trace is an implicit (system inherent) forwarding of SW-C communication data (which flows over the RTE) to the Dlt module. Trace means in this case that no explicit call by the SW-C is made to forward this data to Dlt. This section describes the interaction of the RTE with the Dlt module to record a VFB trace and the internal control of the trace data.

7.1.3.1 Interfaces provided by Dlt for VFB traces

In case the Dlt module is used as a VFB trace client, the RTE has to be configured accordingly. This means that the RTE configuration parameter RteVfbTraceClientPrefix has to be configured with value "Dlt".

The configuration, whether VFB tracing is enabled at all and which traceable events are supported/activated, is solely configured in the RTE module.

From its configuration, the RTE generator then updates in Generation Phase the RTEs Basic Software Module Description with <code>BswModuleEntries</code> for each configured VFB trace hook function. Those <code>BswModuleEntries</code> exactly describe the expected function prototype the configured trace clients have to provide:

- The expected function name is defined by the shortname.
- The rest of the expected signature is defined by the contained arguments.

The DIt module has to provide the implementation for all BswModuleEntries, which are referenced by the attribute outgoingCallback of the BswModuleDescription of the RTE, whose shortname start with "Rte_DIt".

[SWS_DIt_00284] [The Dlt module shall be compliant to the VFB trace described in the AUTOSAR_RTE_SWS.] (SRS_Dlt_00008)

[SWS_DIt_00276] [The Dlt module shall provide the possibility to trace all kinds of trace events described in the SWS RTE. | (SRS_Dlt_00009)

[SWS_DIt_00027] [The DIt module shall provide the implementation of the hook functions for every configured event given by an <code>BswModuleEntry</code>, which owns a shortname starting with "Rte_DIt" provided by the <code>BswModuleDefinition</code> of the RTE. | ()

20 of 117

[SWS_DIt_00335] [The prototype of this hook function is to be taken from the BswModuleEntry of the BswModulDescription of the RTE.] ()

7.1.3.2 Generating hook functions

[SWS_DIt_00285] [Because the interface Dlt_SendTraceMessage is a SW-C interface, an internal function which is equivalent to Dlt_SendTraceMessage shall be implemented to be called by the generated hook functions.] (SRS_DIt_00009)

[SWS_DIt_00277] [In the hook function the internal representation of Dlt_SendTraceMessage shall be called. This call shall be in non-verbose mode.] (SRS_DIt_00009)

[SWS_DIt_00278] The payload for this hook function call shall be filled with the arguments provided by the hook function. All data transported with the arguments shall be provided. ()

[SWS_DIt_00632] [The argument data shall be written in raw format to the payload.]

[SWS_DIt_00279] [Every hook function shall get its own ContextId. In some cases some events can be bundled to the same ContextId. This shall mostly be done if a very large number of signals is traced.] ()

[SWS_Dlt_00337] [The ApplicationID shall be "VFBT". | ()

[SWS_DIt_00484] [The Message Type (MSTP) entry in the generated trace message shall be set to DLT_TYPE_NW_TRACE, the Message Trace Info (MSTI) entry in this case shall be set to DLT_NW_TRACE_IPC.] ()

Note:

The description for the Message ID-payload shall be generated and provided. This description can be generated from the SW-C description file, were the interface is described.

[SWS_DIt_00281] [In each hook function the trace status of the ContextId shall be checked.] ()

```
if (vfb_actual_trace_status_contextXY) {
      <internal_Dlt_SendTraceMessage>(...);
}
```

Figure 3 Requirement for hook function to check the trace status of the ContextId before call of Dlt_SendTraceMessage (vfb_actual_trace_status_contextXY is a freely named variable to hold the actual trace status for a specific ContextId)

[SWS_DIt_00282] [DIt shall use for every VFB trace hook function an own ContextId and thus handle for every VFB trace ContextId a separate trace status. This can be done with a separate variable.] ()

[SWS_DIt_00283] [A separate function shall be implemented to modify the trace status of VFB trace hook functions. This function shall be harmonized with the SW-C LogTraceSessionControl interface.] ()

7.1.4 Log messages from DEM

DEM internally stores events generated by SW-Cs and BSW modules. These events are characterized by event IDs.

To an event in DEM belongs additional information. This information consists of a Diagnostic Trouble Code (DTC), Extended Data Records, and a Freeze Frame. Each time the state of an event changes DEM calls the

Dlt_DemTriggerOnEventStatus function to notify Dlt of this change.
Always use "DEM_DTC_FORMAT_UDS" as parameter for getting the DTCCode.

[SWS_DIt_00474] [DIt shall provide the function

Dlt_DemTriggerOnEventStatus. Within this function, the DEM module provides the EventID of the event which status has changed. With this EventID, the Dlt module shall request additional information about the event. | ()

[SWS_DIt_00475] [In Dlt_DemTriggerOnEventStatus the Dlt module shall compare the old to the new event status. If the event status are not the same Dlt shall build a Dlt log message with the new status and send it by calling Dlt_SendLogMessage.] ()

Info: Log Messages generated for DEM events is not standardized. The parameter structure looks similar like this:

Number	Туре	Name	Description
1	uint32	EventId	the EventId
2	uint32	DTCOfEvent	the DTC of the event
3	RAW	EventExtendedDataRecord	all extended data records
4	RAW	EventFreezeFrameData	the most resent FreezeFrame

[SWS_DIt_00377] [The ApplicationID, ContextId and Message ID of a Log Message sent for a DEM event shall have the following values:

ApplicationID = "DEM" ContextId = "STD0" MessageID = 0x00000001

] ()

[SWS_DIt_00477] [The DTCOfEvent entry from [SWS_DIt_00476] shall be requested from the DEM by calling the function <code>Dem_GetDTCOfEvent</code> with the EventId provided in <code>Dlt_DemTriggerOnEventData</code> and DTCFormatType set to the appropriate format of the DTC value.] (SRS_DIt_00007)

[SWS_DIt_00478] [The EventExtendedDataRecord entry from [SWS_DIt_00476] shall be filled by calling the <code>Dem_DltGetAllExtendedDataRecords</code> function of DEM with the EventId provided in <code>Dlt_DemTriggerOnEventData.</code>] (SRS_DIt_00007)

[SWS_DIt_00479] [The EventFreezeFrameData entry from [SWS_DIt_00476] shall be filled by calling the Dem_DltGetMostRecentFreezeFrameRecordData function of Dem with the EventId provided in Dlt_DemTriggerOnEventData.] (SRS_DIt_00007)

NOTE:

The data in the ExtendedDataRecord and the FreezeFrame are not interpreted by the Dlt module. They are send as raw data and the interpretation should be done at the external client. There could be some description files, like specified in the ODX standard, used.

7.1.5 Log messages from DET

SW-Cs and BSW modules can report errors to the DET module. Such errors can be forwarded to the DIt module as messages with a suitable content using the Dlt DetForwardErrorTrace.

Note:

All parameters from the DET function <code>Det_ReportError</code> are forwarded to the Dlt function <code>Dlt_DetForwardErrorTrace</code> by the DET fan-out capability.

[SWS_DIt_00430] [The DIt module shall provide the

Dlt_DetForwardErrorTrace function for the fan-out capability of DET. J (SRS_Dlt_00006)

[SWS_DIt_00376] [The ApplicationID, ContextId and MessageID of the Log Message send by DET shall have the following values:

ApplicationID = "DET" ContextId = "STD"

MessageID = 0x00000002LogLevel = "Error"

] ()

7.1.6 Recommendation for generation of Message IDs

The payload of non-verbose messages contains the Message ID. The Message ID shall be unique for an ECU. The problem is that Message IDs are provided by a SW-C (the user of Dlt) and at the point in time when coding of the log and trace message calls are done there is no instance to guarantee the uniqueness of used Message IDs.

A possible solution is to map all Log Messages in a virtual memory segment and then use the memory address as Message ID. Another solution is to have an authoring tool that is responsible for the uniqueness of the Message IDs.

In addition, it could be possible to fix Message ID values during the post build process, so uniqueness for the ECU can be guaranteed.

It is important to provide for every Message ID a description for the associated message.

[SWS_Dlt_00031] [MessageIds used for DEM (0x00000001) and DET (0x00000002), and Trace Messages (0x00000003) are reserved and therefore not usable for SW-Cs. | ()

7.1.7 Startup behavior

The Dlt module specifies several configuration parameters, which can be reconfigured during runtime via API calls or via Dlt control messages.

This means, that those configuration parameters respectively data structures, which are based on them, have to be loaded into runtime variables during the startup of the Dlt module.

In addition, it might happen that SW-Cs and/or BSW modules are already generating log and trace data even though the Dlt module itself has not been initialized yet. For this scenario, the Dlt module offers the possibility to buffer even this data until the Dlt module is initialized.

The described functionalities result in the requirements below:

[SWS_DIt_00003] [The Dlt module shall be able to buffer data coming from calls to Dlt_SendLogMessage and/or Dlt_SendTraceMessage even if the Dlt module has not been initialized yet.] (SRS_Dlt_00036)

[SWS_DIt_00648] [When the Dlt_Init is called, the optional timer DltGeneralStartUpDelayTimer shall be started if configured. | ()

[SWS_DIt_00649] [If the parameter DltGeneralNvRAMSupport is disabled, static Dlt module configuration shall be used for initialization.] ()

[SWS_DIt_00005] [As soon as the DIt module is initialized by Dlt_Init and the optional timer DltGeneralStartUpDelayTimer has expired, all the log and trace data, which has been buffered meanwhile, shall be processed as described in section "7.3.6. Sending of Log and Trace Messages". | ()

7.1.8 Persistent storage of configuration

The Dlt module offers the possibility to store configuration data in the NVRamManager module. Therefore, it is recommended to call the Dlt_Init function only after the NVRamManager module has been initialized.

The persistency functionality of the Dlt module supports the non-volatile saving of configuration values, which are modifiable during runtime.

The idea is to allow to customize the logging configuration during runtime and to assure that this configuration is recovered after an ECU reset or restart.

[SWS_DIt_00451] [If the parameter DltGeneralNvRAMSupport is set to TRUE, non-volatile memory blocks shall be used by the Dlt module to store the current Dlt configuration persistently. | ()

[SWS_DIt_00449] [If the parameter DltGeneralNvRAMSupport is set to TRUE, the Dlt module has to verify the validity of the non-volatile blocks used. | ()

[SWS_DIt_00350] [If the parameter DltGeneralNvRAMSupport is set to TRUE, the stored Dlt configuration shall be used as initial values.] ()

Note:

Initial values in this case are the initial values for the persistent stored values for the first startup of the ECU.

[SWS_DIt_00078] [Storing the current configuration to NvRAM shall only be done if the parameter DltGeneralNvRAMSupport is enabled and the storing has been explicitly requested by the Dlt Command "StoreConfiguration". | (SRS_Dlt_00039)

Note:

To store the current configuration to NvRAM, the API NvM WriteBlock is used.

7.1.9 Sending of Log and Trace Messages

The Dlt data path describes the flow a Dlt Log and Trace Message takes from the source to the sink. The source can be either a SW-C or a BSW module, whereas the PDU Router is representing the sink.

The following figure provides an overview of the separate steps to send a Dlt message on the communication bus:

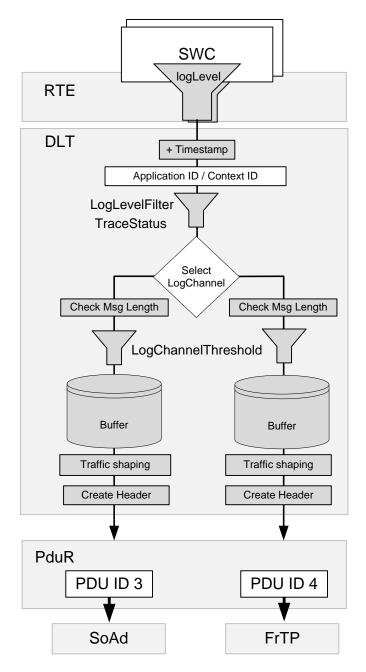

Figure 3 - Example Tx Data Path

[SWS_DIt_00650] [The following steps describe the logical order, in the context of calls to Dlt SendLogMessage or Dlt SendTraceMessage:

- 1. Generate timestamp (see 7.1.9.1)
- 2. Filter message (see 7.1.9.2)
- 3. Select target LogChannel(s) (see 7.1.9.3)
- 4. Check Message length (see 7.1.9.4)
- 5. Apply the current LogChannel threshold (see 7.1.9.5)
- 6. Copy Dlt message to LogChannel specific buffer (see 7.1.9.6)

] ()

Note:

Because of optimizations in an implementation, the order might be changed. For instance, a typical optimization could be, that the Dlt header, which is created by Dlt module for each Dlt message, is NOT saved to the LogChannel specific buffer per Dlt message, but is created on-the-fly directly before sending the message to PduR.

[SWS_DIt_00651] [The following steps have to be taken deferred/decoupled from the context of calls to Dlt SendLogMessage or Dlt SendTraceMessage:

- 7. Send Dlt message to PduR according to TrafficShaping settings. (see 7.1.9.7)
- 8. Create Dlt Header according to header settings (see 7.1.9.8)
- 9. Remove the Dlt message from the LogChannel specific buffer (see 7.1.9.9) ()

7.1.9.1 Generating the timestamp

Depending of the current configuration, a timestamp may be added to the Dlt message.

[SWS_DIt_00652] [Only if the parameter DltHeaderUseTimestamp is set to TRUE, the Dlt module shall fetch a timestamp. | ()

[SWS_DIt_00653] [If the parameter <code>DltHeaderUseTimestamp</code> is set to TRUE, but the Dlt module cannot fetch a timestamp for any reason, the timestamp shall be set to <code>0x000000000.</code>] ()

[SWS_DIt_00654] [[If the parameter DltHeaderUseTimestamp is set to TRUE, the Dlt module shall call the API Gpt_GetTimeElapsed() with the configured channel reference (see DltGeneralGptChannelRef) to fetch the elapsted time.] ()

7.1.9.2 Message filtering

Message filtering means to accept or discard an incoming log or trace message based on the ApplicationId/ContextId tuple, which is assigned to that message.

Filtering differs slightly between Log Messages (Dlt_SendLogMessage) and trace messages (Dlt SendTraceMessage).

[SWS_DIt_00656] [For Dlt Log Messages, the highest LogLevel Threshold shall be defined as "Verbose". | ()

[SWS_DIt_00657] [For DIt Log Messages, the lowest LogLevel Threshold shall be defined as "Filter off". | ()

Note:

The Dlt MessageLogLevelType defines all possible Log Message filter levels.

[SWS_DIt_00658] [For Log Message filtering the DIt internally manages LogLevel threshold to ApplicationId/ContextId tuple mappings (see configuration parameter DltLogLevelThreshold).] ()

[SWS_DIt_00659] [For trace message filtering the DIt internally manages trace activation state to ApplicationId/ContextId tuple mappings (see configuration parameter DltTraceStatusAssignment).] ()

Note:

The matching algorithm for finding the proper mapping element (containing a threshold log level value in the Log Message case respectively containing a trace activation state in the trace message case) is identical for Log Messages and trace messages.

[SWS_DIt_00661] [The DIt module shall find a matching mapping element (log level threshold respectively trace activation state) for the ApplicationId/ContextId tuple contained in a Dlt_SendLogMessage or Dlt_SendTraceMessage call. To do so, the following steps shall be performed:

- 1. Check whether a mapping element exists, where ApplicationId/ContextId tuple of mapping element equals to the ApplicationId/ContextId tuple of the log/trace message. If such a mapping element exists, the matching mapping element is found.
- 2. In case no match has been found in step 1, check whether a mapping element exists, where the ApplicationID equals the ApplicationID of the log/trace message and the ContextId of mapping element equals wildcard (value 0x00000000). If such a mapping element exists, the matching mapping element is found.
- 3. In case no match has been found in step 1 and 2, the matching mapping element is the current <code>DefaultLogLevelThreshold</code> respectively the current <code>DefaultTraceStatus</code>.

| ()

[SWS_DIt_00662] [In the Dlt_SendLogMessage case, the found mapping element is a log level threshold. If the value of the log level threshold is higher than the log level of the Log Message, the message is not further processed and E_OK is returned.] ()

[SWS_DIt_00663] [In the Dlt_SendTraceMessage case, the found mapping element is a trace activation state. If the value of the trace activation state is FALSE, the message is not further processed and E OK is returned. | ()

7.1.9.3 Select target LogChannel

In this step, the Dlt module identifies on which LogChannel(s) the log or tarce message will be transmitted.

[SWS_DIt_00664] [For LogChannel selection the Dlt module manages LogChannel to ApplicationId/ContextId tuple mappings. (see configuration parameter DltLogChannelAssignmentSwcContextRef). | ()

Note:

There can be several LogChannels configured for a given ApplicationId/ContextId tuple contained in a Dlt_SendLogMessage or Dlt SendTraceMessage call.

[SWS_DIt_00665] [To find the matching LogChannels for the

ApplicationId/ContextId tuple contained in a Dlt_SendLogMessage or Dlt_SendTraceMessage call, the Dlt module shall do the following steps:

- From all mapping elements, where ApplicationId/ContextId tuple of mapping element equals to the ApplicationId/ContextId tuple of the log/trace message, the LogChannel shall be added to the list of output LogChannels.
- 2. From all mapping elements, where ApplicationID of mapping element equals to the ApplicationID of the log/trace message AND the ContextId of mapping element equals wildcard (value 0x0000000), the LogChannel shall be added to the list of output LogChannels.
- 3. If the list of output LogChannels is still empty after step 1 and 2. The default LogChannel (see configuration parameter DltDefaultLogChannelRef) shall be added to the list of output LogChannels.

I()

7.1.9.4 Check message length

[SWS_DIt_00666] [If the DIt message length including the required DIt headers exceeds the configured value given by DltLogChannelMaxMessageLength for all assigned LogChannels, discard this DIt message and return DLT_E_MSG_TOO_LARGE. | ()

Note:

If the message is short enough for at least one assigned LogChannel, continue to process this message for all LogChannels where the message is short enough.

7.1.9.5 Apply LogChannel LogLevelThreshold

In this step, the Dlt module decides for each identified target LogChannel, whether the Log Message or trace message might pass according to the LogChannel specific LogLevel threshold respectively TraceStatusFlag.

[SWS_DIt_00667] [Log messages with a LogLevel lower than the configured value of LogChannel threshold for the identified LogChannel shall be discarded and E_OK shall be returned. This shall only be done if this holds true for every LogChannel the LogMessage is assigned to. | ()

[SWS_DIt_00668] [Trace messages shall be filtered out, when the config parameter TraceStatusFlag is FALSE for the identified LogChannel. That means they do not proceed to the next processing step and E_OK is returned.] ()

7.1.9.6 Copying Dlt message to the LogChannel buffer

In this step the Dlt module copies the Dlt message to all buffers of the LogChannels, which the Dlt message is assigned to.

[SWS_DIt_00669] [The DIt module shall copy the log/trace message which has passed the message filters to all assigned target LogChannel buffers where the DIt message length is not larger than DltLogChannelMaxMessageLength of the respective LogChannel.] ()

[SWS_DIt_00670] [If there was not enough space to copy the complete message to any of the assigned LogChannel's buffer, DLT_E_NO_BUFFER shall be returned and the Dlt log and trace message shall be discarded.

In addition, check each assigned buffer whether it was already full before, i.e., check DIt internal flags to store a buffer overflow event:

- If the buffer overflow flag is currently not set for this buffer:
 - Set the buffer overflow flag to indicate the occurrence of a buffer overflow
 - The DIt log and trace message shall be discarded
- If the buffer overflow flag for this buffer was already set for this buffer:
 - The Dlt log and trace message shall be discarded

• Send Dlt Control Message(s) "BufferOverflowNotification" according to the configuration. Please refer to chapter 7.1.11.1.

]()

Note:

The cyclicly called <code>Dlt_TxFunction</code> checks the status of the buffer overflow flag and the debounce time for sending buffer overflow notifications. This function also sets back the flag cyclically according to a buffer overflow notification.

[SWS_Dit_00671] [If a new massage has been copied successfully to the assigned LogChannel's buffer, the message counter shall be increased by 1. This message counter value shall be stored for the Dit message. | ()

Note:

When the Dlt message is going to be transmitted, this message counter value will be written into the Message Counter Field (MCNT).

[SWS_DIt_00672] [If a new massage has been copied successfully to at least one LogChannel buffer, DLT_OK shall be returned.] ()

7.1.9.7 Sending messages from LogChannel Buffer

[SWS_DIt_00780] [The sending of DIt messages via the PduR API shall be decoupled from the Dlt_SendLogMessage and Dlt_SendTraceMessage API call.] ()

Note:

The decoupling is done because of the following reasons:

- 1. Shortening runtime of calls from the SW-Cs/BSWs which trigger log/trace messages, to reduce blocking time.
- 2. In case traffic shaping functionality is enabled, the transmissions have to be processed by an asynchronous cyclic BSW entity anyway.
- 3. In case retry feature is enabled a decoupled BSW entity, which cares for retries, is needed anyway.

[SWS_DIt_00673] [The DIt module shall transmit DIt messages collected in the LogChannel specific buffer from the context of the Dlt TxFunction function. | ()

[SWS_DIt_00674] [The Dlt Message Header shall be assembled before PduR_DltTransmit is called.] ()

Note:

For details regarding the assembling of the Dlt Message Header, please refer to the next section.

[SWS_DIt_00675] [The DIt module shall use the $PduR_DltTransmit$ function to send the DIt message with the configured TxPduld.] ()

[SWS_DIt_00677] [The DIt module shall monitor a transmit counter for each DIt message in a LogChannel specific buffer. Each time it calls PduR_DltTransmit for a DIt message in the buffer, it shall increment the transmit counter.] ()

7.1.9.8 Create Dlt message header

Assembling the DIt Header

[SWS_DIt_00678] [The UEH bit shall be set to '1' if the parameters DltUseExtHeaderInNonVerbMode is set to TRUE.

Otherwise, the UEH bit shall be set to '0'. | ()

[SWS_DIt_00679] [The MSBF bit shall be set to '1' if the current platform is BIGENDIAN.] ()

[SWS_DIt_00680] [The MSBF bit shall be set to '0' if the current platform is LITTLEENDIAN. | ()

[SWS_DIt_00681] [The WEID bit shall be set to '1' if the parameter DItHeaderUseEculd is set to TRUE. Else, the WEID bit shall be set to '0'. | ()

[SWS_DIt_00682] [The WSID bit shall be set to '1' if the parameter DltHeaderUseSessionID is set to TRUE. Else, the WSID bit shall be set to '0'. | ()

[SWS_DIt_00683] [The WTMS bit shall be set to '1' if the parameter DltHeaderUseTimestamp is set to TRUE. Else, the WSID bit shall be set to '0'.] ()

[SWS_DIt_00684] [The VERS bits shall always be set to "001". | ()

[SWS_DIt_00685] [The MCNT field shall be set to the stored value of this DIt message when it is copied to the LogChannel's buffer. | ()

[SWS_DIt_00686] [The optional ECU field shall only exist if DltHeaderUseEculd is set to TRUE. | ()

[SWS_DIt_00687] [The optional ECU field shall be set to the value configured in DltProtocolEcuIdValue. If the configured ECU IDis shorter than 4 byte, the remaining bytes shall be set to 0x00. | ()

[SWS_DIt_00688] [The optional SEID field shall be set to the value configured via DltSwcSessionId and shall only exist if DltHeaderUseSessionID is set to TRUE.] ()

[SWS_DIt_00689] [The optional TMSP field shall contain the derived timestamp if DltHeaderContainsTimeStamp is set to TRUE. | ()

[SWS_DIt_00690] [The LEN field shall be set to the overall length of the finally assembled Dlt Data Message, which shall be the sum of the length of the Header, the length of the optional Extended Header, and the length of the Payload. | ()

Assembling the Dlt Extended Header

[SWS_DIt_00691] [If the parameters DltUseExtHeaderInNonVerbMode is set to TRUE, the Dlt Extended Header has to be generated for Dlt Data Messages: | ()

[SWS_DIt_00692] [The VERB bit shall be set to '1' if the parameter DltUseExtHeaderInNonVerbMode is set to TRUE. Else, the VERB bit shall be set to '0'. |()

[SWS_DIt_00693] [The MSTP field shall be set to 0x0 if the Dlt message has to be assembled due to the API call Dlt_SendLogMessage.]()

[SWS_DIt_00694] [The MSTP field shall be set to 0x1 if the Dlt message has to be assembled due to the API call Dlt_SendTraceMessage.]()

[SWS_DIt_00695] [The MTIN field shall be set accordingly to the Dlt_MessageTraceInfoType value, which has been passed by the API Dlt_SendLogMessage.]()

[SWS_DIt_00696] [The MTIN field shall be set accordingly to the Dlt_MessageTraceInfoType value, which has been passed by the API Dlt_SendTraceMessage.]()

7.1.9.9 Removing messages from LogChannel buffer

[SWS_DIt_00697] [A DIt message, for which PduR_DltTransmit has been called, shall be removed from the LogChannel specific buffer in the following cases:

- PduR DltTransmit has returned with E_NOT_OK,
- A positive TX confirmation for this TxPduld has been received, or
- A negative TX confirmation for this TxPduld has been received and the transmit counter of the Dlt message is greater than the configured DltLogChannelMaxNumOfRetries.

I()

7.1.10 Receiving of Dlt commands

The Dlt module can receive Dlt commands via the Rx Data Path and/or via dedicated API calls (see chapter 8). These Dlt commands can be used to control the Dlt module.

[SWS_DIt_00698] [The DIt module shall ignore all received DIt control messages via the Rx Data Path in case the parameter DltGeneralRxDataPathSupport is set to FALSE. | ()

Note:

In case the Rx Data Path is disabled, the Dlt client can be controlled via the optional control APIs defined in chapter 8.

[SWS_DIt_00699] [If DltGeneralRxDataPathSupport is set to TRUE, the Dlt module shall process received Dlt control messages. | ()

[SWS_DIt_00700] [If a received Dlt command has been executed successfully, "OK" shall be returned. | ()

7.1.10.1 SetLogLevel

[SWS_DIt_00701] [If the DIt command "SetLogLevel" is requested, the new LogLevel shall be stored for the received tuple of ApplicationId/ContextId. | ()

[SWS_DIt_00702] [If the DIt command "SetLogLevel" is requested, but the received tuple of ApplicationId/ContextId is unknown, the DIt command shall be answered with "ERROR". | ()

7.1.10.2 SetTraceStatus

[SWS_DIt_00703] [If the DIt command "SetTraceStatus" is requested, the new trace status shall be stored for the received tuple of ApplicationId/ContextId. | ()

[SWS_DIt_00704] [If the DIt command "SetTraceStatus" is requested, but the addressed tuple of <code>ApplicationId/ContextId</code> is unknown, the DIt command shall be answered with "ERROR".] ()

7.1.10.3 GetLogInfo

[SWS_Dit_00705] [If the Dit command "GetLogInfo" is requested, the requested LogInfo shall be returned.] ()

[SWS_DIt_00706] [If the DIt command "GetLogInfo" is requested, but the addressed tuple of ApplicationId/ContextId is unknown, the DIt command shall be answered with "ERROR".] ()

7.1.10.4 GetDefaultLogLevel

[SWS_DIt_00708] [If the DIt command "GetDefaultLogLevel" is requested, the current value of the parameter DltDefaultLogLevel shall be returned.] ()

7.1.10.5 StoreConfiguration

[SWS_DIt_00709] [If the DIt command "StoreConfiguration" is requested and the configuration parameter DltGeneralNvRAMSupport is set to TRUE, the following steps shall be performed:

- Call NvM_WriteBlock to store the current configuration of the LogChannelAssignment, LogChannelThreshold, and the LogLevelFilter.
 - o If NvM_WriteBlock returned with E_OK, the Dlt command "StoreConfiguration" shall return with "OK".
 - o If NvM_WriteBlock returned with something else than E_OK, the Dlt command "StoreConfiguration" shall return with "ERROR".

1()

[SWS_DIt_00710] [If the DIt command "StoreConfiguration" is requested and the configuration parameter DltGeneralNvRAMSupport is set to FALSE, the DIt command "StoreConfiguration" shall return "NOT_SUPPORTED".] ()

7.1.10.6 RestoreToFactoryDefault

[SWS_DIt_00711] [If the DIt command "RestoreToFactoryDefault" is requested and if the parameter DltGeneralNvRAMSupport is set to FALSE, reset the following runtime parameters to the values stored in the DIt module's static configuration:

- DltDefaultLogLevel
- DltThreshold
- DltDefaultTraceStatus
- DltLogChannelThreshold
- DltDefaultLogChannelRef

]()

[SWS_DIt_00712] [If the Dlt command "RestoreToFactoryDefault" is requested and if the parameter DltGeneralNvRAMSupport is set to TRUE, delete the stored configuration of the NvM by calling NvM_EraseNvBlock and reset the following runtime parameters to the values stored in the Dlt module's static configuration:

- DltDefaultLogLevel
- DltThreshold
- DltDefaultTraceStatus
- DltLogChannelThreshold
- DltDefaultLogChannelRef

I()

[SWS_DIt_00713] [If the Dlt command "RestoreToFactoryDefault" is requested and if the parameter DltGeneralNvRAMSupport is set to FALSE, "OK" shall be returned if the Dlt module reset the current configuration values to the default configuration successfully. | ()

[SWS_DIt_00714] [If the DIt command "RestoreToFactoryDefault" is requested and the parameter DltGeneralNvRAMSupport is set to TRUE, response with "ERROR"

- if the Dlt module could not reset the current configuration to the static default configuration or
- if the stored configuration of the NvM could not be deleted.] ()

7.1.10.7 SetMessageFiltering

[SWS_DIt_00775] [If the DIt command "SetMessageFiltering" is requested, all the DIt filters shall be enabled/disabled as requested, and the DIt command shall be answered with "OK". | ()

7.1.10.8 SetDefaultLogLevel

[SWS_DIt_00715] [If the DIt command "SetDefaultLogLevel" is requested, the parameter DltDefaultLogLevel shall be updated to the received new LogLevel.] ()

7.1.10.9 SetDefaultTraceStatus

[SWS_DIt_00716] [If the DIt command "SetDefaultTraceStatus" is requested, the parameter DltDefaultTraceStatus shall be updated to the received new TraceStatus.] ()

7.1.10.10 GetDefaultTraceStatus

[SWS_DIt_00717] [If the DIt command "GetDefaultTraceStatus" is requested, the current value of the parameter DltDefaultTraceStatus shall be returned.] ()

7.1.10.11 GetLogChannelNames

[SWS_DIt_00718] [If the DIt command "GetLogChannelNames" is requested, the number of configured LogChannels and all LogChannel names given by the parameter DltLogChannelName shall be returned.] ()

7.1.10.12 GetTraceStatus

[SWS_DIt_00719] [If the DIt Command "GetTraceStauts" is requested, the TraceStatus shall be returned for the received tuple of ApplicationId/ContextId. | ()

7.1.10.13 SetLogChannelAssignment

[SWS_DIt_00720] [If the DIt command "SetLogChannelAssignment" is requested with parameter addRemoveOp set to DLT_ASSIGN_ADD, add the tuple of ApplicationId/ContextId to the LogChannel with the name provided by the

parameter logChannelName. The Dlt command shall return "OK" even if the tuple was already assigned to the requested LogChannel before. I ()

[SWS_DIt_00721] [If the Dlt command "SetLogChannelAssignment" is requested with parameter addRemoveOp set to DLT_ASSIGN_REMOVE, remove the tuple of ApplicationId/ContextId from the LogChannel with the name provided by the parameter logChannelName. The Dlt command shall return "OK" even if the tuple was not assigned to the requested LogChannel before. | ()

Note:

If a tuple of ApplicationId/ContextId is not assigned explicitly to any specific LogChannel (any more), the mandatory default LogChannel (see DltDefaultLogChannelRef) will be used for transmission.

[SWS_DIt_00722] [If the DIt command "SetLogChannelAssignment" is requested with an unknown tuple of ApplicationId/ContextId or an unknown LogChannel name, the DIt command shall return "ERROR".] ()

7.1.10.14 SetLogChannelThreshold

[SWS_DIt_00723] [If the DIt command "SetLogChannelThreshold" is requested, the LogChannelThreshold of the addressed LogChannel shall be set to the value received by the parameter newThreshold.] ()

[SWS_DIt_00724] [If the Dlt command "SetLogChannelThreshold" is requested and the logChannelName and/or the newThreshold is unknown, the Dlt command shall return "ERROR". | ()

7.1.10.15 GetLogChannelThreshold

[SWS_DIt_00725] [If the DIt command "GetLogChannelThreshold" is requested, the LogChannelThreshold of the addressed LogChannel shall be returned. | ()

[SWS_DIt_00726] [If the DIt command "GetLogChannelThreshold" is requested and the logChannelName or the newThreshold is unknown, the DIt command shall return "ERROR". | ()

7.1.11 Sending of Dlt commands

Typically, the Dlt module receives Dlt commands generated by a Dlt logging tool, which are answered by the Dlt module. Only two Dlt commands are triggered for sending by the Dlt module itself:

- GetLogInfo (only in case one or more SW-Cs register/unregister themselves)
- BufferOverflowNotification (in case of a buffer overflow)

7.1.11.1 BufferOverflowNotification

The buffer overflow notification is used to inform the Dlt Logging tool about the loss of Dlt messages. The amount of BufferOverflowNotifications on the bus can be limited/debounced by configuration. This notification contains a counter which indicates the amount of lost Dlt messages since the last BufferOverflowNotification.

[SWS_DIt_00776] [If the Dlt module detects a buffer overflow, it shall send a Dlt command "BufferOverflowNotification" cyclically (see DltLogChannelBufferOverflowTimer) as long as the buffer is still full.] ()

[SWS_DIt_00777] [The parameter overflowCounter of the Dlt control message "BufferOverflowNotification" shall be set to the number of lost Dlt messages since the last transmission of the "BufferOverflowNotification". | ()

7.2 Error classification

7.2.1 Development errors

[SWS_DIt_00727] [The following development error types shall be supported:

Type of error	Related error code	Value [hex]
API service called with wrong parameter	DLT_E_PARAM	0x01
Null pointer has been passed as an argument	DLT_E_PARAM_POINTER	0x02
Initialization failed	DLT_E_INIT_FAILED	0x03
Registration failed	DLT_E_REGISTRATION	0x04

I()

7.2.2 Runtime errors

[SWS_DIt_00728] [The following runtime error types shall be supported:

Type of error	Related error code	Value [hex]
Message could not be sent	DLT_E_SKIPPED_TRANSMISSION	0x05
A deprecated parameter with a	DLT_E_DEPRECATED_PARAMETER	0x06
value different to 0 for a Dlt		
command has been received		
Multiple Control Requests at the	DLT_E_MULTIPLE_REQUESTS	0x07
same time		

I()

7.2.3 Transient faults

There are no transient faults.

7.2.4 Production errors

There are no production errors.

7.2.5 Extended production errors

There are no extended production errors.

8 API specification

8.1 Imported types

In this section all types imported from the following modules are listed:

The following types are imported from the specified modules:

[SWS_DIt_00729] [

Module	Imported Type		
ComStack_Types	BufReq_ReturnType		
	PduldType		
	PduInfoType		
	PduLengthType		
	RetryInfoType		
Dem	Dem_DTCFormatType		
	Dem_EventIdType		
	Dem_UdsStatusByteType		
Gpt	Gpt_ChannelType		
	Gpt_ValueType		
NvM	NvM_BlockIdType		
Std_Types	Std_ReturnType		
	Std_VersionInfoType

8.2.4 Dlt_MessageNetworkTraceInfoType

[SWS_DIt_00233] [

Name:	Dlt_MessageNetworkTraceInfoType	
Type:	Enumeration	
Range:	DLT_NW_TRACE_IPC	
	DLT_NW_TRACE_CAN 0x02 CAN communication	
	DLT_NW_TRACE_FLEXRAY	
	DLT_NW_TRACE_MOST	
	DLT_NW_TRACE_ETHERNET 0x05 Ethernet communication	
	DLT_NW_TRACE_SOMEIP	
Description:	This type describes transported type of a Dlt BUSMESSAGE.	

]()

8.2.5 Dlt_ReturnType

[SWS_DIt_00238] [

[O110_DIL_002		
Range:	DLT_E_MSG_TOO_LARGE	0x02 The message is too big for the internal Dlt buffer.
	DLT_E_CONTEXT_ALREADY_REG	The software module context has already registered.
	DLT_E_UNKNOWN_SESSION_ID	0x04 Unknown session id.
	DLT_E_NO_BUFFER	0x05 Buffer overflow.
	DLT_E_CONTEXT_NOT_YET_REG	0x06 The software module context has not registered before.
	DLT_E_ERROR	0x09
Description:		·

(SRS_BSW_00377)

8.3 Function definitions

This is a list of functions provided for upper layer modules.

8.3.1 Dlt_Init

[SWS_DIt_00239] [

Service name:	Dlt_Init		
Syntax:	<pre>void Dlt_Init(const Dlt_ConfigType* config)</pre>		
Service ID[hex]:	0x01		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	config Pointer to a DLT configuration structure		
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
	DIt is using the NVRamManager and is to be initialized very late in the ECU startup phase. The DIt_Init() function should be called after the NVRamManager is initialized.		

J (SRS_BSW_00344, SRS_BSW_00404, SRS_BSW_00405, SRS_BSW_00101, SRS_BSW_00407, SRS_BSW_00358, SRS_BSW_00414)

[SWS_DIt_00453] [If the parameter DltGeneralNvRAMSupport is set to TRUE, the Dlt module shall use the API NvM_ReadBlock of the NVRAM module for restoring the values from persistent storage for the variables required by [SWS_Dlt_00077] in the Dlt Init function.] (SRS_Dlt_00039)

8.3.2 Dlt_GetVersionInfo

[SWS_DIt_00271] [

Service name:	Dlt_GetVersionInfo		
Syntax:	void Dlt_GetVersionInfo(
	Std_VersionInfoType* versioninfo		
Service ID[hex]:	0x02		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	None		
Parameters	None		
(inout):			
Parameters (out):	versioninfo Pointer to where to store the version information of this module.		
Return value:	None		
Description:	Returns the version information of this module.		

| (SRS_BSW_00402)

8.3.3 Dlt_SendTraceMessage

[SWS_DIt_00243] [

Service name:	Dlt_SendTraceM	essage
Syntax:	Std_ReturnType Dlt_SendTraceMessage(Dlt_SessionIDType sessionId, const Dlt_MessageTraceInfoType* traceInfo, const uint8* traceData, uint16 traceDataLength)	
Service ID[hex]:	0x04	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
	sessionId	Number of the module (Module ID within BSW, Port defined argument value within SW-C)
	traceInfo	Structure containing the relevant information for filtering the message.
Parameters (in):	traceData	Buffer containing the parameters to be traced. The contents of this pointer represents the payload of the Trace Message to be sent.
	traceDataLength	Length of the data buffer traceData
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType E_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all assigned LogChannels. DLT_E_NO_BUFFER: Not enough buffer available, the Dlt message cannot be buffered for at least one LogChannel. DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.	
Description:	The service represents the interface to be used by basic software modules or by software components to trace parameters.	

] (SRS_Dlt_00003)]

8.3.4 Dlt_SendLogMessage

[SWS Dlt 00241] [

[<u>0440_DIt_002</u> +	<u>', </u>			
Service name:	Dlt_SendLogMe	Dlt_SendLogMessage		
Syntax:	Std_ReturnType Dlt_SendLogMessage(Dlt_SessionIDType sessionId, const Dlt_MessageLogInfoType* logInfo, const uint8* logData, uint16 logDataLength			
Service ID[hex]:	0x03	0x03		
Sync/Async:	Synchronous	Synchronous		
Reentrancy:	Reentrant	Reentrant		
	sessionId	For SW-C this is not visible (Port defined argument value), for BSW-modules it is the module number		
Parameters (in):	logInfo	Structure containing the relevant information for filtering the message.		
	logData	Buffer containing the parameters to be logged. The contents of this pointer represents the payload of the Log Message to be sent.		

	logDataLength	Length of the data buffer logData.
Parameters (inout):	None	
·	None	
Return value:		DLT_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all assigned LogChannels DLT_E_NO_BUFFER: The LogMessage could not be buffered at any assigned LogChannel DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.
	The service represents the interface to be used by basic software modules or by software component to send Log Messages.	

J (SRS_Dlt_00003)

8.3.5 Dlt_RegisterContext

[SWS_DIt_00245] [

Sandas names				
	Dlt_RegisterContext			
Syntax:	Std_ReturnType Dlt_RegisterContext(
	Dlt_SessionIDType sessionId,			
	Dlt_ApplicationIDType appId, Dlt ContextIDType contextId,			
	const uint8* a			
	uint8 lenAppDe			
		ontextDescription,		
	uint8 lenConte			
)	ACDCSCTIPCTON		
	0x05			
Sync/Async:	Synchronous			
Reentrancy:	Reentrant			
	sessionId	number of the module (Module ID within BSW, Port		
		defined argument value within SW-C)		
	appld	the ApplicationId		
	contextld	the ContextId		
	appDescription	Points to description string for the provided ApplicationId.		
		At maximum 255 characters are interpreted.		
Parameters (in):	lenAppDescription	The length of the description for the ApplicationId string		
		(number of characters of description string).		
	contextDescription	Points to description string for the provided context. At		
	,	maximum 255 characters are interpreted.		
	lenContextDescription	The length of the description string (number of		
	•	characters of description string).		
Parameters	None			
(inout):				
Parameters (out):	None			
	Std_ReturnType	E_OK: The required operation succeeded.		
		DLT_E_CONTEXT_ALREADY_REG: The software		
Return value:		module context has already registered.		
		DLT_E_UNKNOWN_SESSION_ID: The provided		
		session id is unknown.		
Description:	The service has to be called when a software module wants to use services			
		component for a specific context. If a ContextId is being		
	registered for an already registered ApplicationId then appDescription can be			
/CDC D# 0000	NULL and len_appDescr	iption zero.		

J (SRS_Dlt_00033)

8.3.6 Dlt_UnregisterContext

[SWS_DIt_00769] [

[0110 _Bit_00103	4	
Service name:	Dlt_UnregisterCo	ontext
Syntax:	<pre>Std_ReturnType Dlt_UnregisterContext(Dlt_SessionIDType sessionId, Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId)</pre>	
Service ID[hex]:	0x16	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	appld	number of the module (Module ID within BSW, Port defined argument value within SW-C) the ApplicationId the ContextId
Parameters (inout):	None	
Parameters (out):	None	
Return value:		E_OK: The required operation succeeded. DLT_E_CONTEXT_NOT_YET_REG: The software module context has not registered before. DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.
Description:	The service has	to be called when a software module is going to be stopped.

J (SRS_Dlt_00033)

8.3.7 Dlt_DemTriggerOnEventData

[SWS_Dlt_00781] [

Service name:	Dlt_DemTriggerOnEventData	
Syntax:	Std_ReturnType Dlt_DemTriggerOnEventData(
	<pre>Dem_EventIdType EventId)</pre>	
Service ID[hex]:	0x22	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	EventId Identification of an event by assigned EventId	
	None	
(inout):		
Parameters (out):	None	
Return value:	Std_ReturnType E_OK: No error occurred E_NOT_OK: error occured	
Description:	Triggers on changes of the event related data in the event memory.	

J (SRS_Dlt_00007)

8.3.8 Dlt_DetForwardErrorTrace

[SWS_DIt_00432] [

Service name:	Dlt_DetForwardErrorTrace
Syntax:	void Dlt_DetForwardErrorTrace(

	uint	16 moduleId,		
	uint	uint8 instanceId,		
	uint	8 apiId,		
	uint	8 errorId		
)			
Service ID[hex]:	0x07			
Sync/Async:	Synchrono	ous		
Reentrancy:	Non Reent	trant		
	moduleld	Module ID of calling module.		
		The identifier of the index based instance of a module, starting from 0. If the module is a single instance module it shall pass 0 as the instanceld.		
Parameters (in):	apild	ID of API service in which error is detected (defined in SWS of calling module)		
		ID of detected development error (defined in SWS of calling module).		
Parameters (inout):	None			
Parameters (out):	None			
Return value:	None			
Description:	Service to	forward error reports from Det to Dlt.		

J (SRS_Dlt_00006)

8.3.9 Dlt_SetLogLevel

[SWS Dlt 00252] [

[3 11 3]	-1	
Service name:	Dlt_SetLogLevel	
Syntax:	Std_ReturnType Dlt_SetLogLevel(
Service ID[hex]:	0x08	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
	appld	ID of the SW-C
Parameters (in):	contextId	ID of the context
	newLogLevel	new log level to set
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType	E_OK: No error occurred E_NOT_OK: LogLevel could not be changed
Description:	This service is used to ApplicationID/Context	o change the LogLevel for the given tuple of ID.

[(SRS_Dlt_00004, SRS_Dlt_00038)

8.3.10 Dlt_SetTraceStatus

[SWS_DIt_00254] [

Service name:	Dlt_SetTraceStatus	
Syntax:	Std_ReturnType Dlt_SetTraceStatus(
Service ID[hex]:	0x09	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
	appld	ID of the SW-C
Parameters (in):	contextId	ID of the context
	newTraceStatus	New trace status
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Trace status could not be changed
Description:	The service Dlt_SetTraceStatus sets the trace status for a specific tuple of ApplicationID and ContextID.	

] (SRS_Dlt_00004, SRS_Dlt_00038)

8.3.11 Dlt_GetLogInfo

[SWS_Dlt_00732] [

Service name:	Dlt_GetLogInfo	
Syntax:	Std_ReturnType Dlt_GetLogInfo(uint8 options, Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, uint8* status, Dlt_LogInfoType* logInfo	
Service ID[hex]:	0x0a	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	options appld	Used to filter the response in respect to the ApplicationId, ContextId and Trace Status information Representation of the ApplicationId
		Representation of the ContextId
Parameters (inout):	None	
Paramatara (aut)	status	
Parameters (out):	logInfo	Details about the returned Application IDs
Return value:		E_OK: No error occurred E_NOT_OK: LogInfo could not be returned
Description:	Called to request information about registered ApplicationIds, their ContextIds and the corresponding log level.	

8.3.12 Dlt_GetDefaultLogLevel

[SWS_DIt_00733] [

Service name:	Dlt_GetDefaultLogLeve		
Syntax:	Std ReturnType Dlt GetDefaultLogLevel(
	Dlt_MessageLo	gLevelType* defaultLogLevel	
)		
Service ID[hex]:	0x18		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	None		
Parameters	None		
(inout):			
Parameters (out):	defaultLogLevel	Returns the stored LogLevel setting	
Return value:	Std_ReturnType	E_OK: No error occurred	
Return value.		E_NOT_OK: The default LogLevel could not be returned	
Description:		Level currently used by the Dlt module. The returned Log	
	Level might differ from t	he one which is stored non volatile.	

1 ()

[SWS_DIt_00734] [A call to Dlt_GetDefaultLogLevel shall return with E_NOT_OK if the Dlt module cannot return the current value of the parameter DltDefaultLogLevel.] ()

[SWS_DIt_00735] [A call to Dlt_GetDefaultLogLevel shall return with E_NOT_OK if the Dlt module cannot return the current value of the parameter DltDefaultLogLevel.] ()

8.3.19 Dlt_GetLogChannelNames

[SWS_DIt_00749] [

Service name:	Dlt_GetLogChannelNam	es	
Syntax:	Std_ReturnType Dlt_ uint8* number0	GetLogChannelNames(
Service ID[hex]:	0x17		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	None		
Parameters (inout):	None		
Parameters (out)	numberOfLogChannels	Returns the number of configured LogChannels	
Parameters (out):	logChannelNames	Returns a list of configured LogChannel names	
Return value:	Std_ReturnType		
Description:	Returns all configured LogChannel names.		

] ()

8.3.20 Dlt_GetTraceStatus

[SWS_DIt_00750] [

<u>[0110_511_00100</u>	4	
Service name:	Dlt_GetTraceStatu	IS
Syntax:	<pre>Std_ReturnType Dlt_GetTraceStatus(Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, boolean* traceStatus)</pre>	
Service ID[hex]:	0x1f	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	appld	ApplicationId
rarameters (m).	contextId	ContextId
Parameters (inout):	None	
Parameters (out):	traceStatus	current Trace Status of the tuple ApplicationId/ContextId
Return value:	Std_ReturnType	E_OK: No error occurred E_NOT_OK: TraceStatus could not be returned
Description:	Returns the current Trace Status for a given tuple ApplicationId/ContextId.	

<u>()</u>

8.3.21 Dlt_SetLogChannelAssignment

[SWS_DIt_00751] [

Service name:	Dlt_SetLogChanr	nelAssignment
Syntax:	Std_ReturnType Dlt_SetLogChannelAssignment(
Service ID[hex]:	0x20	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
	appld contextld	ID of the addressed application / SW-C ID of the addressed context
Parameters (in):	logChannelName Name of the addressed LogChannel	
	addRemoveOp Operation to add/remove the addressed tuple ApplicationId/ContextId to/from the addressed LogChanne	
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType	
Description:	Adds/removes the addressed tuple ApplicationId/ContextId to/from the addressed LogChannel.	

] ()

8.3.22 Dlt_SetLogChannelThreshold

[SWS_DIt_00752] [

[0110 _Dit_00102	1		
Service name:	Dlt_SetLogChannelT	hreshold	
Syntax:	Std_ReturnType Dlt_SetLogChannelThreshold(
Service ID[hex]:	0x21		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant for different LogChannelNames		
	logChannelName	Name of the addressed LogChannel	
Parameters (in):	newThreshold	Threshold for LogMessages	
r ai airietei 3 (iii).	newTraceStatus	TRUE: enable TraceMessages	
	FALSE: disable TraceMessages		
Parameters	None		
(inout):			
Parameters (out):	None		
Poturn volue	Std_ReturnType	E_OK: No error occurred	
Return value:		E_NOT_OK: Setting of LogChannelThreshold failed	
Description:	Sets the filter thresho	old for the given LogChannel.	

]()

8.3.23 Dlt_GetLogChannelThreshold

[SWS_DIt_00753] [

<u>[3883_DIL_00733</u>	1 1	
Service name:	Dlt_GetLogChannelThreshold	
Syntax:	Std_ReturnType Dlt_GetLogChannelThreshold(
Service ID[hex]:	0x22	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant for different LogChannelNames	
Parameters (in):	logChannelName Addressed LogChannel name	
Parameters (inout):	None	
	logChannelThreshold Current LogChannelThreshold	
Parameters (out):	traceStatus Current TraceStatus. TRUE: TraceMessages enabled. FALSE: TraceMessages disabled.	
Return value:	Std_ReturnType	
Description:	Returns the filter threshold for the given LogChannel.	

] ()

8.3.24 Dlt_InjectCall_<SESSION>

[SWS_DIt_00259] [

<u> </u>	4	
Service name:	Dlt_InjectCall_ <session></session>	
Syntax:	<pre>void Dlt_InjectCall_<session>(Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, uint32 serviceId, uint32 dataLength, const uint8* data)</session></pre>	
Service ID[hex]:	0x14	
Sync/Async:	Asynchronous	
Reentrancy:	Non Reentrant	
	appld	the Application ID
	contextld	the Context ID
Parameters (in):	serviceld	the service ID for the injection (user defined)
r ai ailletei 3 (III).	dataLength	length of the data puffer provided
	data	pointer to data puffer with data belonging to the injection (service ID). The contents of the data is user defined
Parameters	None	
(inout):		

Parameters (out):	None
Return value:	None
	Callback is called by DIt to inject a function call in the SW-C. The behaviour trigged by this function should depend on the service_id also the interpretation of the user data. Both are specific to the application.

] ()

8.4 Call-back notifications

This is a list of functions provided for other modules. The function prototypes of the callback functions shall be provided in the file $Dlt_Cbk.h$.

8.4.1 Dlt_RxIndication

[SWS_DIt_00272] [

	·]	
Service name:	Dlt_RxIndication	
Syntax:	<pre>void Dlt_RxIndication(PduIdType RxPduId, const PduInfoType* PduInfoPtr)</pre>	
Service ID[hex]:	0x42	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
	RxPduld ID of the received PDU.	
Parameters (in):	PduInfoPtr Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.	
Parameters (inout):	None	
Parameters (out):	None	
Return value:	None	
Description:	Indication of a received PDU from a lower layer communication interface module.	

] ()

8.4.2 Dlt_TriggerTransmit

[SWS Dlt 00754] [

<u> </u>	
Service name:	Dlt_TriggerTransmit
Syntax:	<pre>Std_ReturnType Dlt_TriggerTransmit(PduIdType TxPduId, PduInfoType* PduInfoPtr)</pre>
Service ID[hex]:	0x41
Sync/Async:	Synchronous

Reentrancy:	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
Parameters (in):	TxPduId	ID of the SDU that is requested to be transmitted.
Parameters (inout):		Contains a pointer to a buffer (SduDataPtr) to where the SDU data shall be copied, and the available buffer size in SduLengh. On return, the service will indicate the length of the copied SDU data in SduLength.
Parameters (out):	None	
Return value:		E_OK: SDU has been copied and SduLength indicates the number of copied bytes. E_NOT_OK: No SDU data has been copied. PduInfoPtr must not be used since it may contain a NULL pointer or point to invalid data.
	Within this API, the upper layer module (called module) shall check whether the available data fits into the buffer size reported by PduInfoPtr->SduLength. If it fits, it shall copy its data into the buffer provided by PduInfoPtr->SduDataPtr and update the length of the actual copied data in PduInfoPtr->SduLength. If not, it returns E_NOT_OK without changing PduInfoPtr.	

] ()

[SWS_DIt_00755] [If development error detection is enabled for this module, the module shall check all parameters for being valid. If the check fails, the function shall raise a development error and return.] ()

8.4.3 Dlt_TxConfirmation

[SWS_DIt_00273] [

Service name:	Dlt_TxConfirmation	
Syntax:	<pre>void Dlt_TxConfirmation(PduIdType TxPduId, Std_ReturnType result)</pre>	
Service ID[hex]:	0x40	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
	TxPduld	ID of the PDU that has been transmitted.
Parameters (in):		E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.
Parameters (inout):	None	
Parameters (out):	None	
Return value:	None	
Description:	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU.	

] ()

8.4.4 Dlt_TpTxConfirmation

[SWS_DIt_00756] [

<u> </u>	4 1		
Service name:	Dlt_TpTxConfirmation		
Syntax:	<pre>void Dlt_TpTxConfirmation(PduIdType id, Std_ReturnType result)</pre>		
Service ID[hex]:	0x48	0x48	
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	id	Identification of the transmitted I-PDU.	
Parameters (m).	result	Result of the transmission of the I-PDU.	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
Description:	This function is called after the I-PDU has been transmitted on its network, the result indicates whether the transmission was successful or not.		

] ()

8.4.5 Dlt_CopyTxData

[SWS_Dlt_00516] [

Service name:	Dlt_CopyTxData	
Syntax:	<pre>BufReq_ReturnType Dlt_CopyTxData(PduIdType id, const PduInfoType* info, RetryInfoType* retry, PduLengthType* availableDataPtr)</pre>	
Service ID[hex]:	0x43	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant	
Parameters (in):	id info	Identification of the transmitted I-PDU. Provides the destination buffer (SduDataPtr) and the number of bytes to be copied (SduLength). If not enough transmit data is available, no data is copied by the upper layer module and BUFREQ_E_BUSY is returned. The lower layer module may retry the call. An SduLength of 0 can be used to indicate state changes in the retry parameter or to query the current amount of available data in the upper layer module. In this case, the SduDataPtr may be a NULL_PTR.
	retry	This parameter is used to acknowledge transmitted data or to retransmit data after transmission problems. If the retry parameter is a NULL_PTR, it indicates that the transmit data can be removed from the buffer immediately after it has been copied. Otherwise, the retry parameter must point to a valid RetryInfoType element.

		If TpDataState indicates TP_CONFPENDING, the previously copied data must remain in the TP buffer to be available for error recovery. TP_DATACONF indicates that all data that has been copied before this call is confirmed and can be removed from the TP buffer. Data copied by this API call is excluded and will be confirmed later. TP_DATARETRY indicates that this API call shall copy previously copied data in order to recover from an error. In this case TxTpDataCnt specifies the offset in bytes from the current data copy position.
Parameters (inout):	None	
Parameters (out):		Indicates the remaining number of bytes that are available in the upper layer module's Tx buffer. availableDataPtr can be used by TP modules that support dynamic payload lengths (e.g. FrIsoTp) to determine the size of the following CFs.
Return value:		BUFREQ_OK: Data has been copied to the transmit buffer completely as requested. BUFREQ_E_BUSY: Request could not be fulfilled, because the required amount of Tx data is not available. The lower layer module may retry this call later on. No data has been copied. BUFREQ_E_NOT_OK: Data has not been copied. Request failed.
Description:	This function is called to acquire the transmit data of an I-PDU segment (N-PDU). Each call to this function provides the next part of the I-PDU data unless retry-TpDataState is TP_DATARETRY. In this case the function restarts to copy the data beginning at the offset from the current position indicated by retry-TxTpDataCnt. The size of the remaining data is written to the position indicated by availableDataPtr.	

] ()

8.4.6 Dlt_DemTriggerOnEventData

[SWS_DIt_00781] [

<u> </u>		
Service name:	Dlt_DemTriggerOnEventData	
Syntax:	Std ReturnType Dlt DemTriggerOnEventData(
	Dem EventIdType EventId	
Service ID[hex]:	0x22	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	EventId Identification of an event by assigned EventId	
Parameters	None	
(inout):		
Parameters (out):	None	
Dotum volue	Std_ReturnType E_OK: No error occurred	
Return value:	E_NOT_OK: error occured	
Description:	Triggers on changes of the event related data in the event memory.	

| (SRS_Dlt_00007)

8.5 Scheduled functions

8.5.1 Dlt_TxFunction

[SWS Dlt 91005] [

Service name:	Dlt_TxFunction
Syntax:	void Dlt_TxFunction(
	void
)
Service ID[hex]:	0x80
Description:	

I()

[SWS_DIt_00758] [If the configuration parameter

DltGeneralTrafficShapingSupport is set to TRUE, the Dlt messages shall be transmitted with the maximum bandwidth per LogChannel as configured using the parameter DltLogChannelTrafficShapingBandwidth. | ()

[SWS_DIt_00759] [If the configuration parameter

DltGeneralTrafficShapingSupport is set to FALSE, all buffered Dlt messages shall be transmitted at once.] ()

[SWS_DIt_00760] [The Dlt_TxFunction shall check the status of the flag, which indicates that a BufferOverflow occurred:

- If a buffer overflow occurred, the Dlt command "BufferOverflowNotification" shall be sent only once, until the overflow flag is cleared again.
- After a time interval given by the parameter DltLogChannelBufferOverflowTimer, the buffer overflow flag shall be cleared.

This shall be done for every configured LogChannel separately. | ()

[SWS_DIt_00761] [If a DIt message could not be sent, every time the Dlt_TxFunction is called, it shall retry to send this message one time. This shall be done for every message separately and taking care to not exceed the amount of retries given by DltLogChannelMaxNumOfRetries. | ()

8.6 Expected interfaces

In this section all external interfaces required from other modules are listed.

8.6.1 Mandatory interfaces

This section defines all external interfaces which are required to fulfill the core functionality of the module.

The module relies on the following interfaces:

[SWS_DIt_00762] [

API function	Description
PduR_DltTransmit	Requests transmission of a PDU.

I()

8.6.2 Optional interfaces

This section defines all external interfaces which are required to fulfill an optional functionality of the module.

The module relies on the following optional interfaces:

[SWS_DIt_00763] [

API function	Description
	<u> </u>
Dem_DltGetAllExtendedDataRecords	Gets the data of all extended data records of an
	event.
Dem_DltGetMostRecentFreezeFrameRecordData	Gets the data of an most recent freeze frame record
	by event.
	The OBD-II freeze frame is not returned by this
	function.
Dem_GetDTCOfEvent	Gets the DTC of an event.
Det_ReportError	Service to report development errors.
Gpt_EnableNotification	Enables the interrupt notification for a channel
. –	(relevant in normal mode).
Gpt_StartTimer	Starts a timer channel.
NvM_EraseNvBlock	Service to erase a NV block.
NvM ReadBlock	Service to copy the data of the NV block to its
	corresponding RAM block.
NvM_WriteBlock	Service to copy the data of the RAM block to its
	corresponding NV block.

10 Configuration specification

Chapter 10.1 specifies the structure (containers) and the parameters of the module Dlt.

Chapter 10.2 specifies additionally published information of the module Dlt.

10.1 Containers and configuration parameters

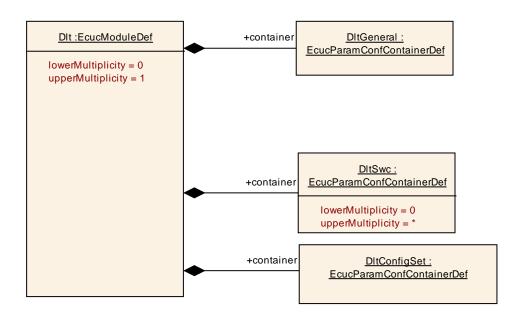

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe chapters 0 and chapter 8.

10.1.1 DIt

SWS Item	ECUC_DIt_00800:
Module Name	Dlt
Module Description	
Post-Build Variant Support	true
Supported Config Variants	VARIANT-LINK-TIME, VARIANT-POST-BUILD, VARIANT-PRE-COMPILE

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DltConfigSet	1	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.
DltGeneral	1	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.
DltSwc		Contains necessary configuration parameters of the AUTOSAR DIt module to interact with SWCs.

10.1.2 DltGeneral

SWS Item	ECUC_DIt_00809:
Container Name	DitGeneral
	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.
Configuration Parameters	

SWS Item	ECUC_DIt_00840 :			
Name	DltGeneralDevErrorDetect	DltGeneralDevErrorDetect		
Description	If the Default Error Tracer (Det) shall be used, this parameter shall be set to TRUE. Otherwise, it shall be set to FALSE.			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_Dit_00847:			
Name	DltGeneralInjectionSupport			
Description	Enables or disables the Dlt I	Enables or disables the Dlt Injection feature.		
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_DIt_00846 :		
Name	DltGeneralRegisterContextNotification		
Description	If this parameter is set to TRUE, a Dlt Control Message is sent every time a SWC registeres and/or de-registers at/from the Dlt Module. Else, this notification is not sent.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	Χ	All Variants
	Link time		
	Post-build time		
Scope / Dependency	scope: local		

SWS Item	ECUC_DIt_00848:			
Name	DItGeneralRxDataPathSupport			
Description	Enables or disables the Rx Data Path to control the Dlt module.			
Multiplicity	1			
Туре	EcucBooleanParamDef	EcucBooleanParamDef		
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time			
	Post-build time			
Scope / Dependency	scope: local			
	dependency: At least one RxPdu needs to be configured if DltGeneralRxDataPathSupport = TRUE			

SWS Item	ECUC_DIt_00897:
Name	DltGeneralStartUpDelayTimer
Description	Configurable delay in s of starting the transmission of Log and Trace

lu lu	messages after the DIt module has been initialized.		
Multiplicity 0	01		
<i>Type</i>	EcucFloatParamDef		
	0.001 10]

SWS Item	ECUC_DIt_00899:
Name	DltIRxPduHandleId

	The numerical value used as the ID of this I-PDU. The DltRxPduHandleId is required by the API calls Dlt_RxIndication, Dlt_TpRxIndication, Dlt_StartOfReception and Dlt_CopyRxData to receive I-PDUs from the PduR (DltIPduDirection: Receive), as well as the PduId passed to an Rx-I-PDU-callout.				
Multiplicity	01				
Туре	EcucIntegerParamDef (Symbolic Name generated for this parameter)				
Range	0 65535				
Default value					
Post-Build Variant Multiplicity	true				
Post-Build Variant Value	true				
Multiplicity Configuration	Pre-compile time	Χ	VARIANT-PRE-COMPILE		
Class	Link time	Χ	VARIANT-LINK-TIME		
	Post-build time	Χ	VARIANT-POST-BUILD		
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE		
	Link time	Χ	VARIANT-LINK-TIME		
	Post-build time	Χ	VARIANT-POST-BUILD		
Scope / Dependency	scope: ECU		_		

SWS Item	ECUC_DIt_00898:			
Name	DltRxPduldRef			
Description	Reference to the "global" Pdu structure to allow harmonization of handle IDs in the COM-Stack.			
Multiplicity	1			
Туре	Reference to [Pdu]			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE	
	Link time	Χ	VARIANT-LINK-TIME	
	Post-build time	Χ	VARIANT-POST-BUILD	
Scope / Dependency	scope: local		_

10.2 Published Information

Published information contains data defined by the implementer of the SW module that does not change when the module is adapted (i.e. configured) to the actual HW/SW environment. It thus contains version and manufacturer information.

Additional module-specific published parameters are listed below if applicable.
